

**Key Points**  
**Chapter-16\_Probability\_XI(mathematics)**

An experiment is said to be a **random experiment** if there are more than one possible outcomes and whose outcomes cannot be predicted in advance.

**Ex:** Tossing of a coin, throwing of a die, drawing of a card from playing cards.....

**Coin:** On tossing a coin there are two possibilities either head may come up or tail may come up.

**Die:** A die is a well-balanced cube with its six faces marked with numbers (dots) from 1 to 6, one number on the one face. The plural of die is dice.

**Cards:** A pack of cards consists of four suits i.e., **Diamonds, Hearts, Spades and Clubs**. Each suit consists of 13 cards, nine cards numbered 2, 3, 4, ....., 10 and an Ace, a King, a Queen and a Jack or Knave. Colour of Spades and Clubs is black and that of Hearts and Diamonds is **red**. King, Queen and Jack cards are called **Face cards**.

All possible results of a random experiment are called its outcomes.

**Sample Space:** The set of all possible outcomes of a random experiment is called the Sample Space and is denoted by '**S**'.

All elements of a sample space are known as **Sample points**.

An **event** is a subset of a sample space associated with a random experiment.

**Types of Events:**

**Simple or Elementary event:** Each outcome of a random experiment is called an elementary event (Or) An event contains single element is called a simple event.

**Compound Event:** If an event has more than one outcome is called compound event.

**sure event:** An event associated with a random experiment is called *Sure event*, if it always occurs when the random experiment is performed.

**Impossible event:** An event associated with a random experiment is an *impossible event* if it never occurs.

**Ex:** On throwing of a die, the sample space is  $S = \{1, 2, 3, 4, 5, 6\}$

$\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}$  are called elementary events.

Getting an even prime number is an event A.  $A = \{2\}$  is an elementary event.

Getting an odd number is an event B.  $B = \{1, 3, 5\}$  is a compound event

Getting a number  $> 4$  is an event C.  $C = \{5, 6\}$  is a compound event.

Getting a number  $< 7$  is an event D.  $D = \{1, 2, 3, 4, 5, 6\} = S$  is sure event.

Getting a number  $> 6$  is an event E.  $E = \{ \} = \Phi$  is an impossible event.

**Equally Likely Events:** Two events are said to be equally likely, if none of them is expected to occur in preference to the other.

For example, if we toss a coin, each outcome head or tail is equally likely to occur.

**Algebra of Events:**

**Complementary events:** Given an event A, the complement of A is the event consisting of all sample space outcomes that do not correspond to the occurrence of A and is written as **Not A** Or  $\bar{A}$  Or  $A^c$  Or  $A^c$ .

**Ex:** On throwing of a die, the sample space is  $S = \{1, 2, 3, 4, 5, 6\}$   
 $A = \text{Getting an odd number} = \{1, 3, 5\}$ ;  $\text{Not } A = S - A = \{2, 4, 6\}$

**The Event 'A or B':** If A and B are any two events of a random experiment, then the event A or B denoted by  $A \cup B$  is the event of all outcomes which are either in A or in B or in both.

**Eg:** In the random experiment of throwing a die once, if

A = getting a number less than 3 =  $\{1, 2\}$

B = getting an odd number =  $\{1, 3, 5\}$  then  $A \cup B = \{1, 2, 1, 3, 5\} = \{1, 2, 3, 5\}$ .

**The Event 'A and B':** If A and B are any two events of a random experiment, then the event 'A and B' denoted by  $A \cap B$  is the event of all outcomes which are both in A and B.

**Eg:** In the random experiment of throwing a die once, if

A = getting a number less than 3 =  $\{1, 2\}$

B = getting a prime number =  $\{2, 3, 5\}$  then  $A \cap B = \{2\}$ .

**The Event 'A but not B':** If A and B are any two events of a random experiment, then the event 'A but not B' denoted by  $A \cap \bar{B}$  is the event of all outcomes which are in A but not in B.  
 $A \cap \bar{B} = A - B = A - (A \cap B)$ .

**Eg:** In the random experiment of throwing a die once  $S = \{1, 2, 3, 4, 5, 6\}$   
 $A =$  getting a number less than 3  $= \{1, 2\}$ ,  $B =$  getting a number greater than 4  $= \{5, 6\}$   
 $\bar{B} = S - B = \{1, 2, 3, 4\}$  then  $A \cap \bar{B} = A - B = \{1, 2\}$ .  $A \cap \bar{B} = \{1, 2\}$ .

**The Event 'neither A nor B':** If A and B are any two events associated with a random experiment, then the event 'neither A nor B' denoted by  $\bar{A} \cap \bar{B} = \overline{A \cup B}$ .

**The Event 'not A or not B':**  $\bar{A} \cup \bar{B} = \overline{A \cap B}$ .

**The Event exactly one of A or B:**  $\bar{A} \cap B$  or  $A \cap \bar{B}$

**Mutually Exclusive Events:** Two or more events are said to be *mutually exclusive events* if the occurrence of any one of the event prevents the occurrence of the other. i.e

Two events A and B are mutually exclusive if  $A \cap B = \emptyset$ . i.e. A and B are disjoint sets.

**Eg:** Three coins are tossed.  $S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\}$

$A =$  Not more than one head  $= \{HTT, THT, TTH, TTT\}$ ,

$B =$  Exactly two heads  $= \{HHT, HTH, THH\}$ ,

$C =$  Three heads  $= \{HHH\}$

Here  $A \cap B = B \cap C = A \cap C = \emptyset$ . So, the events A and B, B and C, A and C are mutually exclusive events.

**Exhaustive Events:** If  $E_1, E_2, \dots, E_n$  are n events of a sample space S and if  $E_1 \cup E_2 \cup E_3 \cup \dots \cup E_n = S$ , then  $E_1, E_2, \dots, E_n$  are called *exhaustive events*.

Two or more events are said to be *exhaustive events* if their union is the sample space.

**Mutually Exclusive and Exhaustive Events:**

If  $E_1, E_2, \dots, E_n$  are n events of a sample space S and if  $E_i \cap E_j = \emptyset$  for every  $i \neq j$  i.e.

$E_i$  and  $E_j$  are pairwise disjoint and  $E_1 \cup E_2 \cup E_3 \cup \dots \cup E_n = S$ , then the events

$E_1, E_2, \dots, E_n$  are called mutually exclusive and exhaustive events.

**Probability of an Event:** If there are 'n' equally likely elementary events (outcomes) of a random experiment, 'm' outcomes are favourable to the event A, then the probability of happening or occurrence of the event A is defined as

$$P(A) = \frac{m}{n} = \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{n(A)}{n(S)}$$

**Note:** Clearly (i)  $0 \leq P(A) \leq 1$ , (ii)  $P(A) = 0$ , if  $A = \emptyset$  (iii)  $P(A) = 1$ , if  $A = S$

**Probability of not happening an event:** Let A be any event. Then  $\bar{A}$  or  $A^c$  or  $A^I$  denotes the Event of not happening A.

Therefore, if there are 'n' outcomes for a random experiment and 'm' outcomes are favourable to A, then (n - m) outcomes are not favourable to A.

$$\therefore P(\text{not } A) = P(\bar{A}) = \frac{n-m}{n} = 1 - \frac{m}{n} = 1 - P(A).$$

$$P(A) + P(\bar{A}) = 1$$

**Addition rule for Probability:** We have  $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

$$\frac{n(A \cup B)}{n(S)} = \frac{n(A)}{n(S)} + \frac{n(B)}{n(S)} - \frac{n(A \cap B)}{n(S)}$$

$$P(A \text{ or } B) = P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

**For any three events:**

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C)$$

If A and B are **mutually exclusive**, then  $P(A \cup B) = P(A) + P(B)$

**Note:** At least  $\Rightarrow \geq$  (greater than or equal to); At most  $\Rightarrow \leq$  (less than or equal to)

Total number of possible outcomes on throwing of

(i) 'n' coins  $= 2^n$

(ii) 'n' dice  $= 6^n$

(iii) P ( Sure event )  $= 1$ ;

(iv) P(Impossible event)  $= 0$

**Factorial (!):**

$$7! = 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 7 \times 6! = 7 \times 6 \times 5!$$

$$n! = 1 \times 2 \times 3 \times \dots \times (n-1) \times n = n \times (n-1) \times (n-2) \times \dots \times 3 \times 2 \times 1 = n \times (n-1)!$$

$$n_{c_r} = \frac{n!}{(n-r)!r!}$$

$${}^7C_3 = \frac{7!}{(7-3)!3!} = \frac{7!}{(4)!3!} = \frac{7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{4 \times 3 \times 2 \times 1 \times 3 \times 2 \times 1} = 7 \times 5 = 35 \quad (\text{Or}) \quad {}^7C_3 = \frac{7 \times 6 \times 5}{3!} = \frac{7 \times 6 \times 5}{3 \times 2 \times 1} = 35$$
